Edward James Weston

eddweston@me.com

I enjoy working with a diverse group of people with different opinions, who all strive to find the best solutions. I am a believer in the agile development approach, eliminating large feedback loops and encouraging open and honest communication. I believe small commits and frequent small releases are important to reduce risk and decrease the time to deliver real value to customers. I like to take on larger projects where I see technological impediments or process issues in the wider department.

I am a self-motivated person who strives to improve my technical knowledge and soft skills through reading, research and personal projects. Our relationships at work are critical to helping each other succeed, so I seek regular feedback from my colleagues and regularly reflect on interactions with my teams and others I work with.

EMPLOYMENT

Vonage *(2013 - Current)*

Throughout my time at Vonage I have progressed through different teams and roles in order to continuously challenge myself.

Staff Software Architect (2024 – Current)

Since being promoted to Staff Architect, I have focused on cross-functional leadership and architectural governance alongside my team based responsibilities;

- Architecture Review Process: Introduced a periodic architecture review of each team-owned domain, built around interactive sessions with the whole team. Findings become actionable tickets in the teams' non-feature backlogs, and the administration is automated with an agentic AI workflow that is now shared with the wider architecture group.
- Non-Feature Work Prioritisation: Introduced a unified process for prioritising non-feature work (tech debt, vulnerabilities, availability and bugs) across my teams, so that time is allocated to the right tickets. Gained buy-in from the Director and Engineering Managers.
- Component Reliability Categorisation: Designed and am rolling out a framework that classifies every platform component into reliability tiers with matching availability targets and declared dependencies. This ensures the most critical components are also the most resilient, improving the availability of the platform.
- I am the Architecture lead for a very successful new agent user interface project released in 2025, which involved coordinating between teams in 4 geographies and earned me a Top Performance award from our parent company.

Senior Software Architect (2022 – 2024)

In 2022 I looked for a new challenge and decided to join the architecture team in the apps organisation. In this role I practise consultative architecture with my 5 assigned teams.

- I help to document teams' existing architecture, help teams to plan the architectural direction of the domains they own. I also work closely with the product team to plan future architecture and check the technical feasibility for planned product enhancements.
- I also took on ownership of the department wide Tech Radar, helping us to set technical direction within the organisation.

Senior Software Engineer (2021 – 2022)

- Due to a shift in the department to stream-aligned teams, my team was again merged with another. The teams domain was assigned as the Agent Experience. My efforts to organize and update this area of the product led to us owning it. Whilst in this team I have taken opportunities to lead technically with WebRTC and work in the UI as well as more generally in the team, gaining a promotion recognizing these efforts.
- I have also looked to solve department wide problems with this solution, as many teams contribute to it, I felt the need to better share the technical direction the team wanted to take with the project. I authored the contributing guide for the project including a project specific Tech Radar.

Software Engineer (2013 – 2021)

- In my first two teams I was a Windows based .net Framework engineer working in mostly MVC projects. I was focused on TDD, improving my C#, and had an interest in process improvement. I gained knowledge of our telephony stack and then started working with WebRTC call delivery.
- In my next team I learned golang and was core to developing our contact centres API Platform. This project is still in use, handling ~260m requests each day. In this team I also worked hard to improve my front end skills, learning Javascript, React and Redux. I took ownership of a whole department meeting, to help share knowledge and solve common problems across teams.
- My previous team merged with another and my responsibilities widened. I was now part of a team that owned our most used UI, the supporting services and browser extensions for it, our UI for contact centre agents. As the team developed I pushed for improvements to the performance of this interface. I also extracted its core code from our monolith, enabling us to deploy it independently. I quickly took the opportunity (during a hackathon) to try and use the WebRTC offering from another company that Vonage had purchased. Once successful I built a business case to convince leadership to implement the work properly. The eventual work saved us ~$6m in fees from an external WebRTC call delivery vendor.

Hewlett Packard *(2011 - 2013)*

Software Developer

- In this role, I developed parts of a new multi-threaded component in C++ on Red Hat Enterprise Linux. I gained knowledge in object orientated design patterns and experience in unit testing. While in this team I took responsibility for the CI pipeline for the team.

Intel Corporation UK *(2007 - 2008)*

Technical Marketing Engineer

- I completed a year’s work for Intel as my placement year in between my studies. I ran benchmarks to support marketing efforts for both Desktop and server components.

EDUCATION

Loughborough University (2005 – 2009)

- BEng Electronic and Electrical Engineering - 2:1 Honours

SKILLS

Languages, Frameworks and Technologies

C#, .net, JavaScript, Typescript, Svelte, React, Redux, Docker, MySQL, Microservices, AWS, GCP

INTERESTS

In my spare time, I enjoy running, working on personal projects, and spending time with my family.
